

Tensor's InterAx™ geogrid goes under Oklahoma pickleball/tennis courts

CLIENT'S CHALLENGE

The City of Ardmore, Oklahoma was constructing tennis and pickleball courts in a local park. The City was seeking a solution to provide longevity of the paved surfaces to deliver a high-quality space for their constituents. They also want to minimize cracking and the associated maintenance.

TENSAR SOLUTION

Tensor's InterAx geogrid was installed over a soft, lime treated subgrade. About 12" of crusher run aggregate was placed prior to pouring the concrete for the sports courts.

Using the geogrid to support the pavement, the contractor was able to deliver another high quality project to the City, and the City had the peace of mind that the pavements will last.

The project referenced herein was a demonstration project. The geogrid materials involved were provided under a confidentiality agreement and were not commercial sales.
